Fox River Status Update  
July 16, 2017

## **Current Conditions**

Inflows to the Chain of Lakes have crested and are falling, with a greater reduction than anticipated. Fox Lake stage is 7.9 feet and appears to be cresting today. All gates at Stratton and Algonquin Dams are opened.

The dam in Burlington has not breached. Burlington, WI is experiencing record flooding on the Fox River.

## **Forecast**

The National Weather Service is forecasting up to 1" of rain over the Fox River watershed next 5 days as shown in Figure 1. The Fox River near New Munster is forecasted to continue to fall, but it will be over one week before it falls below flood stage.

This flow is higher than we have seen on the Chain, so our lake and river stage estimates are interpolated from our known information. There is some uncertainty because we have no historic record to compare.

Fox Lake gage may crest from 8.0 - 8.1 ft on July 16. The current stage is 7.9 ft.  
Stratton HW gage will crest over 5.9 – 6.3 ft on July 16. The current stage is 5.4 ft.  
Stratton TW gage may crest over 7.3 – 7.7 ft on July 16. The current stage is 7.2 ft.
